EDUCATION

University of Pittsburgh, Pittsburgh, PA

Expected December 2026

Bachelor of Science in Computer Science; Minor in Math

- GPA: 3.88/4.0
- Relevant Courses: Algorithms and Data Structures, Systems Software, Intro to Machine Learning, Software Quality Assurance, and Database Management Systems

TECHNICAL SKILLS

Java, PostgreSQL, Python, C#, C++, HTML, CSS, Git/Github, Visual Studio

RELEVANT EXPERIENCE

Ansys (Part of Synopsys), Canonsburg, PA

January 2025 - Present

Software Engineer Intern

Rotation 1: January 2025 – April 2025

- Implemented a mock plugin manager system in C# to simulate plugin discovery, registration, and communication, enabling testing of CAD data integration.
- Migrated XML parsing from Xerces to PugiXML, simplifying code and improving maintainability.

Rotation 2: August 2025 – December 2025

- Built modular C++ components for converting geometry data between multiple formats, improving interoperability across engineering tools and workflows.
- Developed a CAD controller in C++ to automate geometry data exchange and ensure stable integration across engineering applications.
- Wrote 100+ unit tests across multiple core geometry-integration components, expanding automated validation coverage and improving reliability.

Rotation 3: May 2026 – Present

- Developing a flexible gRPC plugin management system using Protocol Buffers to decouple data transfer, enabling support for multiple data models while maintaining compatibility with legacy systems.

Conair, Cranberry Township, PA

May 2025 - August 2025

Software Engineer Intern

- Developed a mock SQL server on an edge device to emulate database responses, enabling a connected machine to transmit queries for cloud processing.
- Built an Azure IoT Edge module using Docker to enable containerized deployment on edge devices.
- Developed a python script to capture SQL queries from TCP packets and reroute them to the Azure Cloud in JSON format for centralized processing.
- Reduced device setup time by automating software installation with a Python script, eliminating manual steps and improving deployment efficiency across edge devices.

SELECTED PROJECTS

2nd Place SteelHacks Hackathon: One Call Away

March 2024

- Developed a Python-based fall detection and emergency notification system using computer vision to automatically detect falls and alert emergency contacts, collaborating with a team to deliver the project in 22 hours.
